

Hybrid Parallel Execution Model for Logic-Based Specification Languages

Parallel processing is a very important technique for improving the performance of various software development and maintenance activities. The purpose of this book is to introduce important techniques for parallel execution of high-level specifications of software systems. These techniques are very useful for the construction, analysis, and transformation of reliable large-scale and complex software systems.

Languages can be classified into multiple paradigms. Some paradigms are concerned mainly with implications for the execution model of the language, For parallel computing, using a programming model instead of a language is
