# Professional Data Warehousing with SQL Server 7.0 and OLAP Services

With the vast amounts of data flowing through the workplace on a daily basis, Data warehouses have evolved to cope with the huge volumes involved by separating the data used for reporting and decision making from the operational systems. Microsoft have entered the world of datawarehousing with the introduction of SQL Server 7 and OLAP Services. The purpose of the data warehouse is simply to store the raw data. The combination of this with OLAP enables the data to be transformed into useful information that reflects the real factors affecting the enterprise. OLAP techniques may range from simple navigation and browsing of the data to more serious analyses, such as time-series and complex modeling.
